Abstract

The **AI-Powered WhatsApp Taxi Booking and Management System** is a smart transportation application designed to make taxi booking simple, fast, and convenient through WhatsApp. Traditional taxi booking systems often require users to install applications and navigate through multiple screens. This project provides an easier approach by allowing users to book taxis and interact with the system through a familiar WhatsApp interface.

The system allows users to provide their **pickup location, destination, and ride requirements** through WhatsApp. AI and Natural Language Processing (NLP) are used to understand user messages and assist with booking-related queries. The system can manage **customer details, taxi bookings, driver information, and ride status**, while location services can help identify routes and travel information.

The application can be developed using **Python** for AI and NLP, **Node.js** for backend services, **WhatsApp Business Cloud API** for communication, **MySQL** for database management, **Google Maps API** for location services, **Firebase** for cloud support, **GitHub** for version control, and **Postman** for API testing.

The main objective of the system is to provide an **efficient, accessible, and user-friendly taxi booking experience**. By combining WhatsApp, AI, and digital taxi management, the system can simplify the booking process and improve communication between customers, drivers, and administrators.
